

1. Pehle ek network banaenge (10.124.0.0/16)
2. Isme two subnets banaegne -
ek frontend-subnet (10.124.0.0/24),
ek bastion-subnet(10.124.1.0/26),
3. Frontend-subnet me 2 vm dalenge Private IP ke saath
4. Bastion Subnet me ek VM Dalenge public ip wala (allow 22 port)
5. Frontend subnet ki dono vm pr nginx dalna hai
6. Indore ke apne computer se powershell open karenge and jump server me ssh karenge
ssh devopsadmin@<public-ip>
7. jump vm se andar se frontend vm 1 and frontend vm 2 ko connect kar paenge
8. Network ke andar me private communication ho jata hai.. sudo apt update karenge vo fatt
jaega.. internet hi nahi chlega..
9. Ab azure ki VM me internet access karne ke lie NAT gateway subnet level par lagana pdta hai
10. NAT gateway bana ke subnet pr laga denge.. fir sudo apt install nginx karenge to chl jaega
11. Ek Loadbalancer banaene click click karke..
LB banane ke baad frontendIP configuration bananege
12. LB backend pool and health probe banaenge
13. Traffic ko round robin ko backend pool me distribute karega
14. LB ki lp pr hit marenge

- Duniya ki kisi bhi loadbalancing service me
1. Frontend IP Configuration
 2. Backend Pool
 3. Health Probe
 4. Loadbalancing Rule
