|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| What is Azure Landing Zone?                                                                                                                                                  |
| <b>Hindi:</b> Ek pehle se configured, secure, scalable, reliable, azure pr infra ka environment hai, With best practices application ke workload ko deploy karne ke lie      |
| <b>English:</b> Azure landing zone is preconfigured, scalable, reliable, secure azure infrastructure environment where application workload is deployed with best practices. |
| It includes                                                                                                                                                                  |
| 1. Hierarchy (Management Group/ Subscription)                                                                                                                                |
| 2. Identity ( Entra ID, Group, User, PIM, RBAC)                                                                                                                              |
| 3. Networking (Hub and Spoke, Flat, Vnet, subnet, etc...)                                                                                                                    |
| 4. Governance ( Azure Policy, Initiatives, And Blueprints)                                                                                                                   |
| 5. Security (WAF, Firewall, Private Endpoint, NSG etc..)                                                                                                                     |
| 6. Monitoring and Logging ( Azure Monitor, Log Analytics Workspace)                                                                                                          |
| 7. Backup and DR (RTO and RPO)                                                                                                                                               |
| 8 Cost Optimization (Azure Advisor)                                                                                                                                          |

| Explain Management Group Hierarchy in Azure? |
|----------------------------------------------|
| On Top, There will be a tenant root group    |

| What is difference between platform / landing zone subscription? |
|------------------------------------------------------------------|
| Platform = Shared Services<br>Landing Zone = Actual Workload     |

| Explain Hub and Spoke Architecture?                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Recommended Network Architecture in crreation of landing zone                                                                                                                                                                         |
| Where central hub hosts shared services like Hub Vnet, Firewal, VPN gateway etc...                                                                                                                                                    |
| And multiple spoke vnets hosts application workload connected to hub using vnet peering                                                                                                                                               |
| Hub Vnet that is central layer contains shared and critical services like azure firewall, vpn gw, express route, dns, bastion                                                                                                         |
| Spoke Vnet that is called workload layer, Each spoke usually, contains one application infrastructure requirements resources like VM, VMss, ACL, App Services Etc... And there is no direct internet exposure to the spoke workloads. |

| What are the best practices of creating the landing zone?                                                 |
|-----------------------------------------------------------------------------------------------------------|
| 1. Always spoke to spoke communication is not done directly, it goes via hub firwall with UDR integrated. |
| 2. Always access paas services in the spoke network using private endpoints                               |
| 3. if possible, deploy architecture with multi region design                                              |

| Advantages of Hub and Spoke                              |
|----------------------------------------------------------|
| Cost Optimization as shared services reduces duplication |
| Single firewall for all workloads                        |
| Centralised Security                                     |
| Scalability                                              |
| Isolation                                                |
